

QE Hospital - Woolwich

Year 2000/2001

This £95 million, 571 bed acute general hospital, was one of the first major PFI projects in the country. The project utilised an LTHW radiant heating system in order to provide an unobtrusive, low maintenance and effective heating solution that freed up the maximum amount of valuable floor and ceiling space.

The Atrium heating panel was chosen for its extremely high efficiency and ultra lightweight construction. Furthermore, the high integrity construction provided life-cycle expectancy in excess of 25 years. The panel was utilised throughout the hospital in areas such as Wards, Surgeries, A&E Department and MHU.
