

## Project Vauxhall - Nottinghamshire

### Year 2006

A desire to provide the ultimate comfort conditions for building occupants meant that radiant cooling was the preferred choice for this headquarter development. Frenger provided a bespoke chilled ceiling system for areas with moderate heat gains and radiant/convective Carat passive beams where higher cooling duties were required. Viewed from below, the aesthetic differences between the complimentary technologies were totally concealed above a high specification metal ceiling system, also provided by Frenger.
